

- * Time series : is a set of observations on the values that a variable takes at different times.

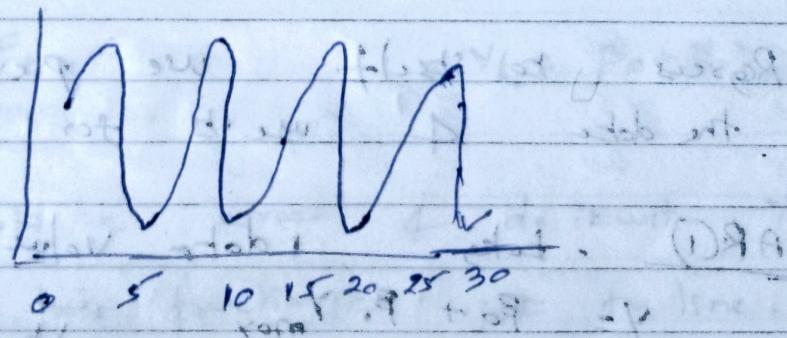

Example : sales trend, stock market prices, weather forecast

Time series Data patterns

- * Trend - There is an upward trend in the figure. over the period of time the broad value goes up & sales increase
 - There is an upward & downward. no sales in beginning gradually picks up reaches peak & there is downwards.

Seasonality

- It follows a cycle. very fixed cycle.

Sine series

straight form series

Random - white noise is completely random
 there is no relation b/w past & future data.
 we cannot do time series analysis.

White Noise

- * A series purely random in nature is called as white noise
- * Mean = 0, constant Variance & uncorrelated.

Average is the best forecast of this series

Auto Regressive (AR) model

* y_t depends only of past values $y_{t-1}, y_{t-2},$

$$y_t = f(y_{t-1}, y_{t-2}, y_{t-3})$$

$$y_t = \beta_0 + \beta_1 y_{t-1} + \beta_2 y_{t-2} + \beta_3 y_{t-3} \dots$$

Regress to itself. (we previous value of the date for use it for regression.)

AR(1) - take 1 data value

$$y_t = \beta_0 + \beta_1 y_{t-1}$$

June \rightarrow multiply by factor.

June monthly sales is dependent on May monthly sales
 constant

Linear Equation.

$$Y = aX + b$$

Value prediction using the previous month.

B_0 - intercept

B_1 - slope

If $P=1$ AR(1)

$$AR(2) \Rightarrow Y_t = B_0 + B_1 Y_{t-1} + B_2 Y_{t-2}$$

Simple regression on a single variable by taking a time series - uses the past time values to predict the current time values.

If correlation b/w past value & current value high it will be able to predict better.

Moving Average (MA) model

Y_t depends only on random error terms

$$Y_t = f(\epsilon_t, \epsilon_{t-1}, \epsilon_{t-2}, \epsilon_{t-3}, \dots)$$

or

$$Y_t = \underbrace{\beta + \epsilon_t + \theta_1 \epsilon_{t-1} + \theta_2 \epsilon_{t-2} + \theta_3 \epsilon_{t-3} + \dots}_{\text{error}}$$

$$Y_{t-1} \rightarrow \epsilon_{t-1}$$

gives

$$Y_t = B_0 + B_1 Y_{t-1} + \epsilon_t$$

Error

calculating with errors
Take the errors & do it with Y_t .
& use this function to fit the lines.

ARMA model

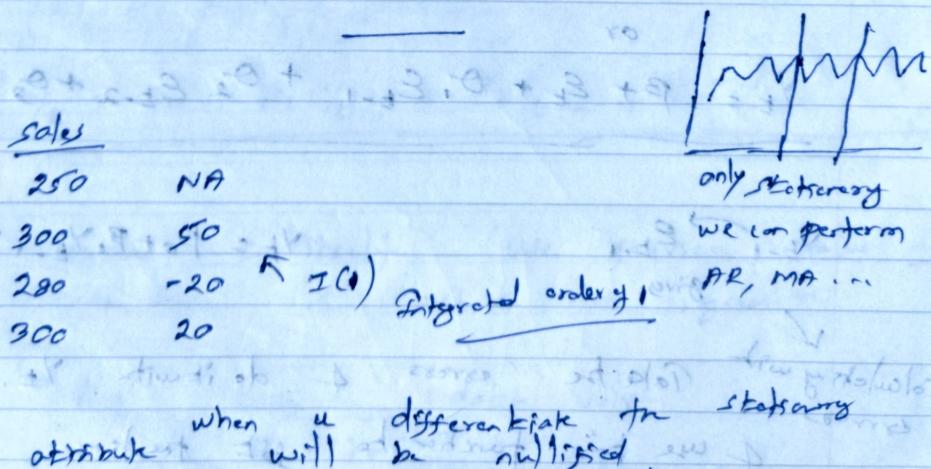

Combines AR and MA

$$Y_t = \beta_0 + \beta_1 Y_{t-1} + \beta_2 Y_{t-2} + \beta_3 Y_{t-3} \dots$$

$$\epsilon_t + \theta_1 \epsilon_{t-1} + \theta_2 \epsilon_{t-2} + \theta_3 \epsilon_{t-3}$$

Stationarity of Time series

- * A series is said to be "strictly stationary" if the mean, variance & covariance is constant over period of time or time invariant.
- * A series which is not stationary can be made stationary after differencing.
- * After differencing once, the series is called a integrated of order 1 and denoted by I(1). In general I(d)

why stationarity

- * Most models assume stationarity of data.
In other words, standard techniques are invalid if data is non-stationary.
- * Auto-correlation may result due to non-stationarity.
- * Autoregression results in spurious regression.

Time series is non-stationary, we cannot apply any model & results in spurious regression.

* Make data stationary - by strongly differencing it, Integrated order of 1
Differencing once.

ARIMA model $P \quad d \quad q$
ARIMA: AutoRegressive Integrated Moving Average
combining all three methods.

It has three patterns (P, d, q)

ARIMA $(0, 0, 1)$ - only applying MA

$(1, 1, 1)$ - Auto regression using one value prior to it AR(1)

$0, 0, 0$ $I(1)$ - one difference

* Most successful model is $(0, 0, 0)$ non stationary to stationary

time series analysis MA with q values of 1 using error.

Autocorrelation

* Autocorrelation is the similarity between observations as a function of the time lag between them.

Correlation with x_t vs x_{t-1} to +1

/
 very correlated

X increasing
y increasing

zero = no correlation.

correlate a variable to itself

x_t is correlated with x_{t-1}

	x_t	x_{t-1}	
Jan	250	NA	- How much is this month
300	250		only related to past month sales.
280	300		
300	280		
350	300		+ correlation unif.
350			$x \approx x = 1$

(0.7) writing x_t x_{t-1}

0.7 +ve correlate.

Akaike Information Criterion (AIC)

The AIC is defined by a simple equation from the sum-of-squares + number of degrees of freedom of the two models

$$\Delta AIC = N \times \ln \left(\frac{SS_2}{SS_1} \right) + 2 \Delta DF$$

↓ Mean squared error
Very minimum..

Moving Averages

<u>Week</u>	<u>Sales</u>	<u>3 Week MA</u>	<u>Error</u>	<u> Error </u>	<u>Error²</u>	<u>MAD</u>	<u>MSE</u>	<u>MAPE</u>
1	39							
2	44							
3	40							
4	45	$= \frac{39+44+40}{3} = 41$	4	4	16	8.89		
5	38	$= \frac{44+40+45}{3} = 43$	-5	5	25	13.16		
6	43	$= \frac{40+45+38}{3} = 41$	2	2	4	4.67		
7	39	$= \frac{45+38+43}{3} = 42$	-3	3	9	7.69		
8		$\frac{38+43+39}{3} = 40$		$14/4$	54	34.39		
						MAD = 3.5	1	1
							13.5	8.607

Error = Forecast value - Actual Value

$$45 - 41 = 4$$

$$38 - 43 = -5$$

$$43 - 41 = 2$$

$$39 - 42 = -3$$

|Error| - Errors & Deviation denoted interchangeably.
Two bars around Error here denote absolute Value

MAE (Mean Absolute Error) - We simply average these absolute errors. First we sum up the absolute errors & then divide the total by 4

$$\text{MAE} = \frac{4+5+2+3}{4} = 14/4 = 3.5$$

mean Absolute Deviation

$$\text{Error}^2 = 16 + 25 + 4 + 9 / 4 = 13.5$$

Mean Squared Error (MSE)

|% Error| - Mean Absolute percent error

The absolute percent error is a measure of the error as a percentage of actual value

$$\text{MAPE} = \frac{|\text{Error}|}{\text{Actual}} \times 100\%$$

Mean Absolute

$$\cdot = \frac{4}{45} = 8.89\%$$

percentage error.

$$\frac{5}{38} = 13.16\%$$

$$\frac{4}{43} = 9.30\%$$

$$\frac{3}{39} = 7.69\%$$

$$\text{MAPE} = \frac{\text{sum of Abs}}{\text{Actual}} = \frac{134.39}{38} = 3.53\%$$

$$\text{MAPE} = \frac{134.39}{38} = 3.53\%$$

$$\text{MAPE} = \frac{134.39}{38} = 3.53\%$$

$$\text{MAPE} = \frac{134.39}{38} = 3.53\%$$

Forecasting

Exponential Smoothing

objectives

calculate forecasts = using exponential smoothing
calculate mean squared error, MSE

	A _t	F _t	F _{t+1}
1	39	39	$F_1 = A_1$
2	44	39	$F_2 = 0.2 \times 39 + 0.8 \times 39$
3	40	40	$F_3 = 0.2 \times 44 + 0.8 \times 39$
4	45	40	$F_4 = 0.2 \times 40 + 0.8 \times 40$
5	38	41	$F_5 = 0.2 \times 45 + 0.8 \times 40$
6	43	40.40	$F_6 = 0.2 \times 38 + 0.8 \times 41$
7	39	40.92	$F_7 = 0.2 \times 43 + 0.8 \times 40.40$
8	40.57	$F_8 = \dots$	\dots

$$F_{t+1} = F_t + \alpha (A_t - F_t)$$

where α is smoothing constant
 $0 \leq \alpha \leq 1$

$$F_{t+1} = \cancel{\alpha} A_t + (1-\alpha) F_t$$

$$\text{Smoothing Forecast } \quad \alpha = 0.2$$

$$1 - \alpha = \underline{0.8}$$

$$F_{t+1} = 0.2 (A_t) + 0.8 (F_t)$$

Week	Sales	Forecast	Error	Error ²
1	39	39	0	0
2	44	39.00	5.00	25.00
3	40	40.00	0.00	0.00
4	45	40.00	5.00	25.00
5	38	41.00	-3.00	9.00
6	43	40.40	2.60	6.76
7	39	40.92	-1.92	3.69

$$MSE = \overline{11.58}$$

Add the squared errors & divide by 6

$$MSE = 11.58$$

7	39
8	39

2WMA

Weight: 3 + 2

$$3+2=5$$

1. $\frac{3(44) + 2(39)}{5} = 42.0$
 2. $\frac{3(40) + 2(44)}{5} = 41.6$
 3. $\frac{3(45) + 2(40)}{5} = 43.0$
 4. $\frac{3(38) + 2(45)}{5} = 40.8$
 5. $\frac{3(43) + 2(39)}{5} = 40.6$

Soln We multiply the sales value by the weight as we did before, but in this case, we also divide by the total weight, which is 5.

Weeks Sales 2WMA

1	39	
2	44	
3	40	42.0
4	45	41.6
5	38	43.0
6	43	40.8
7	39	41.0
8		40.6

$$F_3 = \frac{3(44) + 2(39)}{5}$$

$$F_4 = \frac{3(40) + 2(44)}{5}$$

$$F_5 = \frac{3(45) + 2(40)}{5}$$

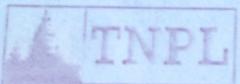

$$F_6 = \frac{3(38) + 2(45)}{5}$$

$$F_7 = \frac{3(43) + 2(39)}{5}$$

$$F_8 = \frac{3(39) + 2(43)}{5}$$

<u>Error</u>)	<u>Week</u>	<u>Sales</u>	<u>2WMA</u>	<u>Error</u>)
	1	39		
	2	44		
	3	40	42.0	2.0
	4	45	41.6	3.4
	5	38	43.0	5.0
	6	43	40.8	2.2
	7	39	41.0	2.0

On averaging five values, we obtain Mean Absolute Deviation Value 2.92

Comparing Forecast Errors

Actual	Forecast	MAD	Standard Deviation
2.48	2.48	0.8	1

Method	MAD	Standard Deviation
4-Week MA	0.8	1
Weighted Average (Weights: 0.4, 0.3, 0.2, 0.1)	3.07	1.6
2-Week MA	0.8	1
Weighted Average (Weights 0.4 0.2 0.4)	2.92	1

Since the MAD is an error measure,
smaller MADs produce better smoothing of
the data.

∴ Using MAD, the 2-week
weighted average method produced a better forecast.

$$(P_1)_{\text{E}} + (P_2)_{\text{E}} = 8.7 + 8.2 = 16.9 \quad P_3 = 16.9 + 0.8 = 17.7$$

$$2) (P_2)_{\text{E}} + (P_3)_{\text{E}} = 8.2 + 8.1 = 16.3 \quad P_4 = 16.3 + 0.8 = 17.1$$

$$3) (P_3)_{\text{E}} + (P_4)_{\text{E}} = 8.1 + 8.0 = 16.1 \quad P_5 = 16.1 + 0.8 = 16.9$$

$$4) (P_4)_{\text{E}} + (P_5)_{\text{E}} = 8.0 + 7.9 = 15.9 \quad P_6 = 15.9 + 0.8 = 16.7$$

$$5) (P_5)_{\text{E}} + (P_6)_{\text{E}} = 7.9 + 7.8 = 15.7 \quad P_7 = 15.7 + 0.8 = 16.5$$

$$6) (P_6)_{\text{E}} + (P_7)_{\text{E}} = 7.8 + 7.7 = 15.5 \quad P_8 = 15.5 + 0.8 = 16.3$$
